Please note: these screenshots were taken from Chrome, so we recommend using Chrome, if possible. They will also work with Firefox, but the visuals will be slightly different.

1) Log in to your library’s homepage, and under databases navigate to Scopus

2) Your browser might warn you that the institution’s security certificate doesn’t cover this URL; in this case you’ll have to allow your browser to continue:
   a. From this “Your connection is not private” screen please click on ADVANCED at the bottom of the page. Additional text will appear below.
b. Please click on the link that is displayed at the bottom of the page (see screenshot below), which reads “Proceed to 0-www-scopus-com.www.consuls.org (unsafe).” Scopus will then load, but please don’t stop reading the directions; there may be an additional step to make Scopus functional.

3) Once connected on Scopus, check if you are experiencing the login popup issue demonstrated below, i.e. the login screen with username and password boxes is displayed at all times and you cannot close it, even if you provide valid credentials (see screenshot)
4) In the case of a login popup issue, please open a new tab and copy and paste this link into the browser: https://0-acw-elsevier-com.www.consuls.org/SSOCore/jawr_loader.js which should lead to this security error page:
5) Click on ADVANCED and then click on the link at the bottom of the page that reads 0-acw.elsevier.com.www.consuls.org (unsafe)

6) The page should now display some textual code (shown in the screenshot below)
7) Close this tab and refresh the Scopus page. The login popup should disappear and Scopus is now back to normal. Please continue to use the same browser to access Scopus. As long as you do not clear cookies or cache, you should not have to repeat these steps.
